

Appendix G

Socioeconomic Data

Sources of Demographic Data Used in the Draft Environmental Impact Statement (EIS)

Several sources of demographic data were used for the analyses in this Draft EIS. The following describes the data sources used, where they were used in the document, and why the data sources were selected.

U.S. Census Bureau Data

The U.S. Census Bureau is the dominant source of demographic and socioeconomic data used in this Draft EIS. Total population, race, and ethnicity data were sourced from the 2010 Census and income, ability to speak English and other socioeconomic data were sourced from the 2006-2010 American Community Survey (ACS) 5-year survey.

Between the 2000 and 2010 Census a redistricting effort occurred which resulted in the subdivision of some census geography along the US 281 project corridor. As such, the 2010 Census geography is numbered differently than the 2000 Census geography. The 2010 Census and the 2006-2010 ACS data rely on the 2010 Census geography. A 2000 to 2010 geography conversion chart is shown in **Table G-10**.

2000 and 2010 Census and 2006-2010 ACS data were used in:

Chapter 1 – Need for and Purpose of the Proposed Action

Chapter 3 – Affected Environment and Environmental Consequences

Chapter 4 – Indirect Effects

Chapter 5 – Cumulative Effects

U.S. Census Bureau Income Data Verification Process

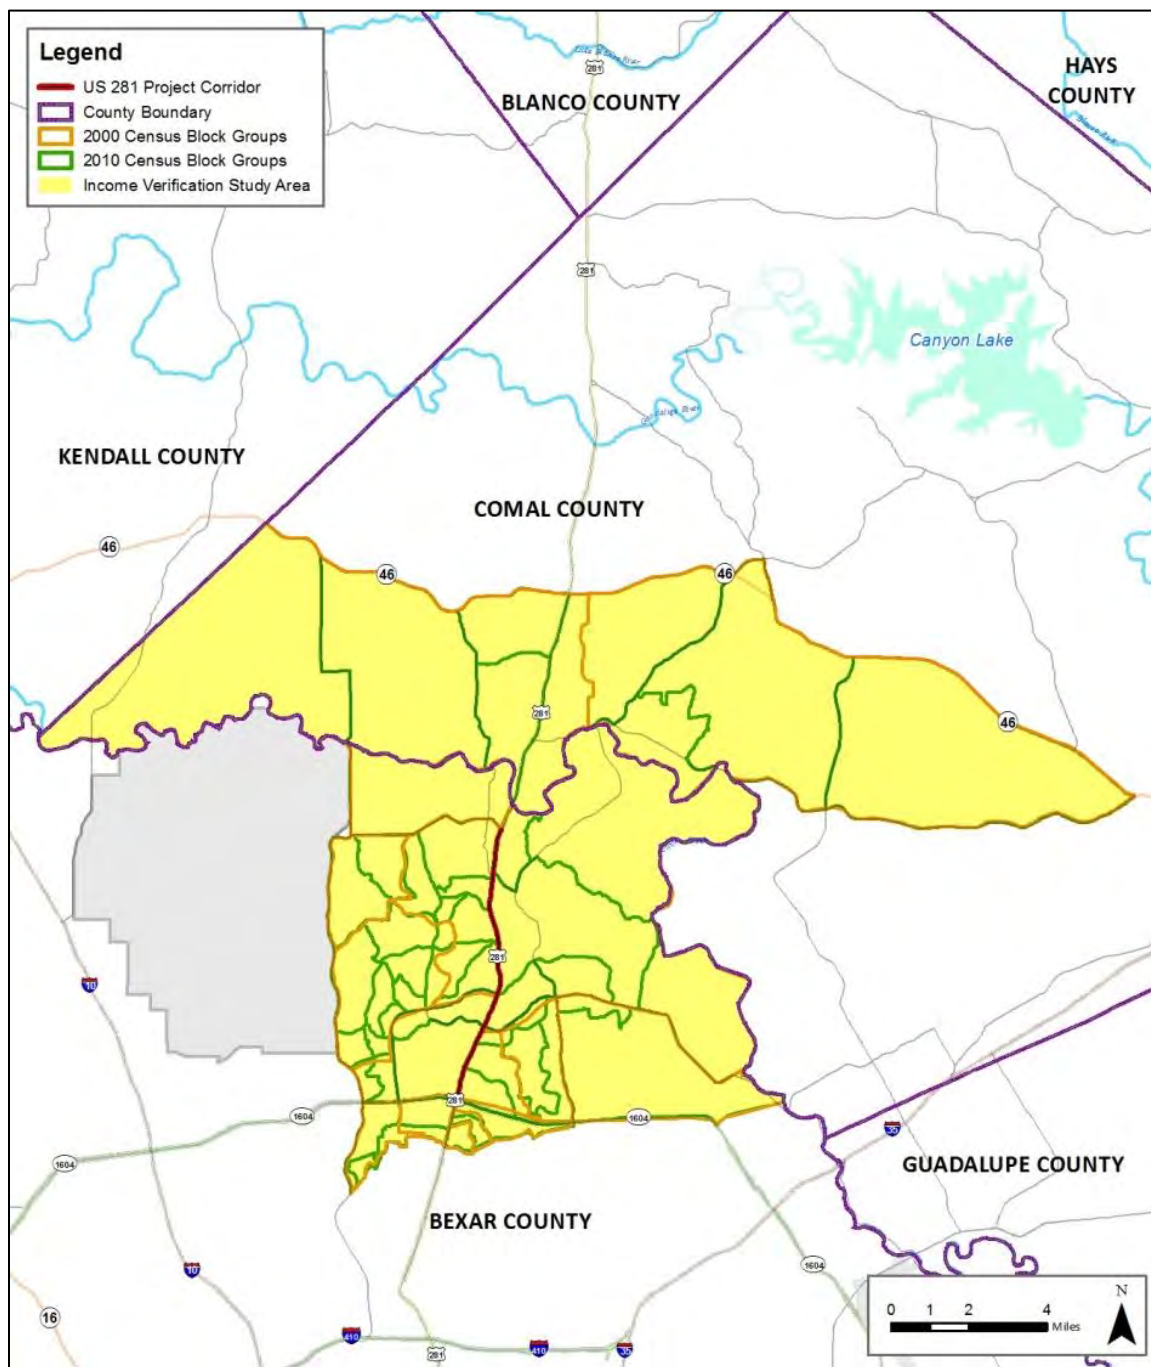

As of 2010, income data are no longer reported as part of the decennial census conducted by the US Census Bureau but, instead, is now only part of the Bureau's American Community Survey (ACS). Where the decennial census reports data from a complete count, the ACS reports data are based on samples and are therefore subject to margins of error. ACS income data affect how low-income populations are identified for the purposes of environmental justice analysis. The Federal Highway Administration, Texas Division and the Alamo Regional Mobility Authority have agreed upon a process to determine if the 2006-2010 ACS income data are the "best available" source in comparison with 2000 Census income data. If the data verification process concludes that there are no statistically significant differences between the two datasets, then the 2006-2010 ACS data are considered to be the "best available" data, and if there are differences between the datasets that are statistically significant, the results of this analysis will be reported in the US 281 Draft EIS and the text will note the limitations of the data used.

Developing a Study Area

A study area was developed in order to compare the median household income data from the 2000 Census with the 2006-2010 ACS. The 2000 Census utilizes 2000 block groups and the 2006-2010 ACS utilized 2010 block groups. As these two sets of geographies are not the same, a study area was drawn where the 2000 and 2010 geographies overlap the most. **Figure G-1** highlights the study area used for this analysis and delineates the 2000 and 2010 block groups, and **Table G-1** lists the block group numbers. While the 2000 block groups and 2010 block groups share similar boundaries, they are not exactly the same.

3 *Adjusting the 2000 Census Income Data to Create an Equal Comparison with the 2006-2010 ACS*

4 Median household income data reported in the 2000 Census were collected through one survey and represent
5 the income earned in FY 1999 in 1999 dollars. In comparison, the 2006-2010 ACS surveys collected data each
6 month in 2006 through 2010; the data report income earned in the last 12 months based from the month and year
7 the survey was conducted. Each survey point was inflated, based on the Bureau of Labor Statistics (BLS)
8 Consumer Price Index (CPI) for each month and year to 2010 dollars. Research conducted by Posey, Welniak and
9 Nelson for the Census Bureau found that these methodological differences resulted in a difference in the income
10 reported; income reported in the Census was higher than income reported in the ACS. When comparing 2000
11 Census income data (inflated to 2000 dollars) with 2000 ACS income data (reported in 2000 dollars), the
12 difference was about 4.6 percent throughout the US overall and 4.7 percent in the state of Texas. They also noted
13 that these differences were not the same throughout the country; for example the difference in the state of
14 Oklahoma was only 1.1 percent (Posey, Welniak, Nelson 2003).

Based on the findings of this research, the following steps were taken to adjust the 2000 Census median household income to ensure an equal comparison with the 2006-2010 ACS median household income. **Table G-2** shows the adjustments made to the 2000 Census median household income data collected for the US 281 study area.

- **Step 1** – Inflate the 2000 Census Median Household (HH) Income data from 1999 dollars to 2000 dollars using the Bureau of Labor Statistics, Consumer Price Index (1.03361339)
- **Step 2** – Reduce the 2000 Census Median HH Income (2000 dollars) by 4.7 percent (difference noted by Posey, Welniak and Nelson for the state Texas)
- **Step 3** – Inflate the adjusted 2000 Census Median HH Income (2000 dollars) to 2010 dollars using the Bureau of Labor Statistics, Consumer Price Index (1.30854107).

Table G-2: Adjustments to the 2000 Census Median Household Income Data

1. [Select category](#) 2. Choose calculator 3. **Enter data** 4. View results

t test calculator

A *t* test compares the means of two groups. For example, compare whether systolic blood pressure differs between a control and treated group, between men and women, or any other two groups.

Don't confuse *t* tests with correlation and regression. The *t* test compares one variable (perhaps blood pressure) between two groups. Use correlation and regression to see how two variables (perhaps blood pressure and heart rate) vary together. Also don't confuse *t* tests with ANOVA. The *t* tests (and related nonparametric tests) compare exactly two groups. ANOVA (and related nonparametric tests) compare three or more groups. Finally, don't confuse a *t* test with analyses of a contingency table (Fishers or chi-square test). Use a *t* test to compare a continuous variable (e.g., blood pressure, weight or enzyme activity). Use a contingency table to compare a categorical variable (e.g., pass vs. fail, viable vs. not viable).

Findings

The T-test concludes that the differences between the adjusted 2000 median household income data and the 2006-2010 ACS median household income data are not statistically significant. As such, this analysis concludes that the 2006-2010 ACS median household income data are the "best available."

San Antonio-Bexar County Metropolitan Planning Organization (SA-BC MPO)

Projections for Mobility 2035:

To help ensure consistency with local and regional plans and policies, demographic projections developed by the SA-BC MPO for *Mobility 2035* were used to describe the future demographic conditions along the US 281 Project Corridor through 2035. These projections use a geography called Traffic Analysis Zones (TAZ) which share common boundaries with U.S. Census tracts and include statistics about population, employment and households for the SA-BC MPO's metropolitan planning area (Bexar, Comal, Guadalupe, Kendall, and Wilson counties).

SA-BC MPO Projections for *Mobility 2035* were used in:

Chapter 1 – Need for and Purpose of the Proposed Action

Chapter 3 – Affected Environment and Environmental Consequences

The Texas State Data Center (TSDC) and Environmental Systems Research Institute (ESRI):

The TSDC and ESRI provide population projections at the county level for the US 281 project corridor and were used for the demographic analysis found in **Chapter 4 – Indirect Effects**. In order to analyze indirect effects, an area of influence (AOI) was established which represents the geographic area where probable encroachment-alterations and induced land development effects of the proposed project are likely to occur. The AOI is approximately 560 square miles and includes portions of Bexar, Blanco, Comal and Kendall counties. The SA-BC MPO projections were not used in this analysis because the SA-BC MPO's metropolitan planning area does not include Blanco County. As such, population data developed by TSDC and ESRI and analyzed by SA Research Corporation were used to describe the projected population growth through 2035 for the four counties intersecting the AOI as well as for the AOI. As shown in **Figure 3-4 in Chapter 3 – Affected Environment and Environmental Consequences**, the projections developed by the TSDC are comparable to the projections developed by the SA-BC MPO.

TSDC and ESRI Projections were used in:

Chapter 4 – Indirect Effects

U.S. Department of Labor, Bureau of Labor Statistics (BLS):

The BLS collects employment and unemployment statistics on an annual basis at the regional and county level. While employment data is available from the U.S. Census Bureau, it is only current through 2000 as of June 2011, and is only released every ten years. To help ensure that the most current and accurate data were used, and to demonstrate year-to-year employment/unemployment trends, BLS employment and unemployment data were used for the socioeconomic analysis in **Chapter 3 – Affected Environment and Environmental Consequences**.

BLS data were used in:

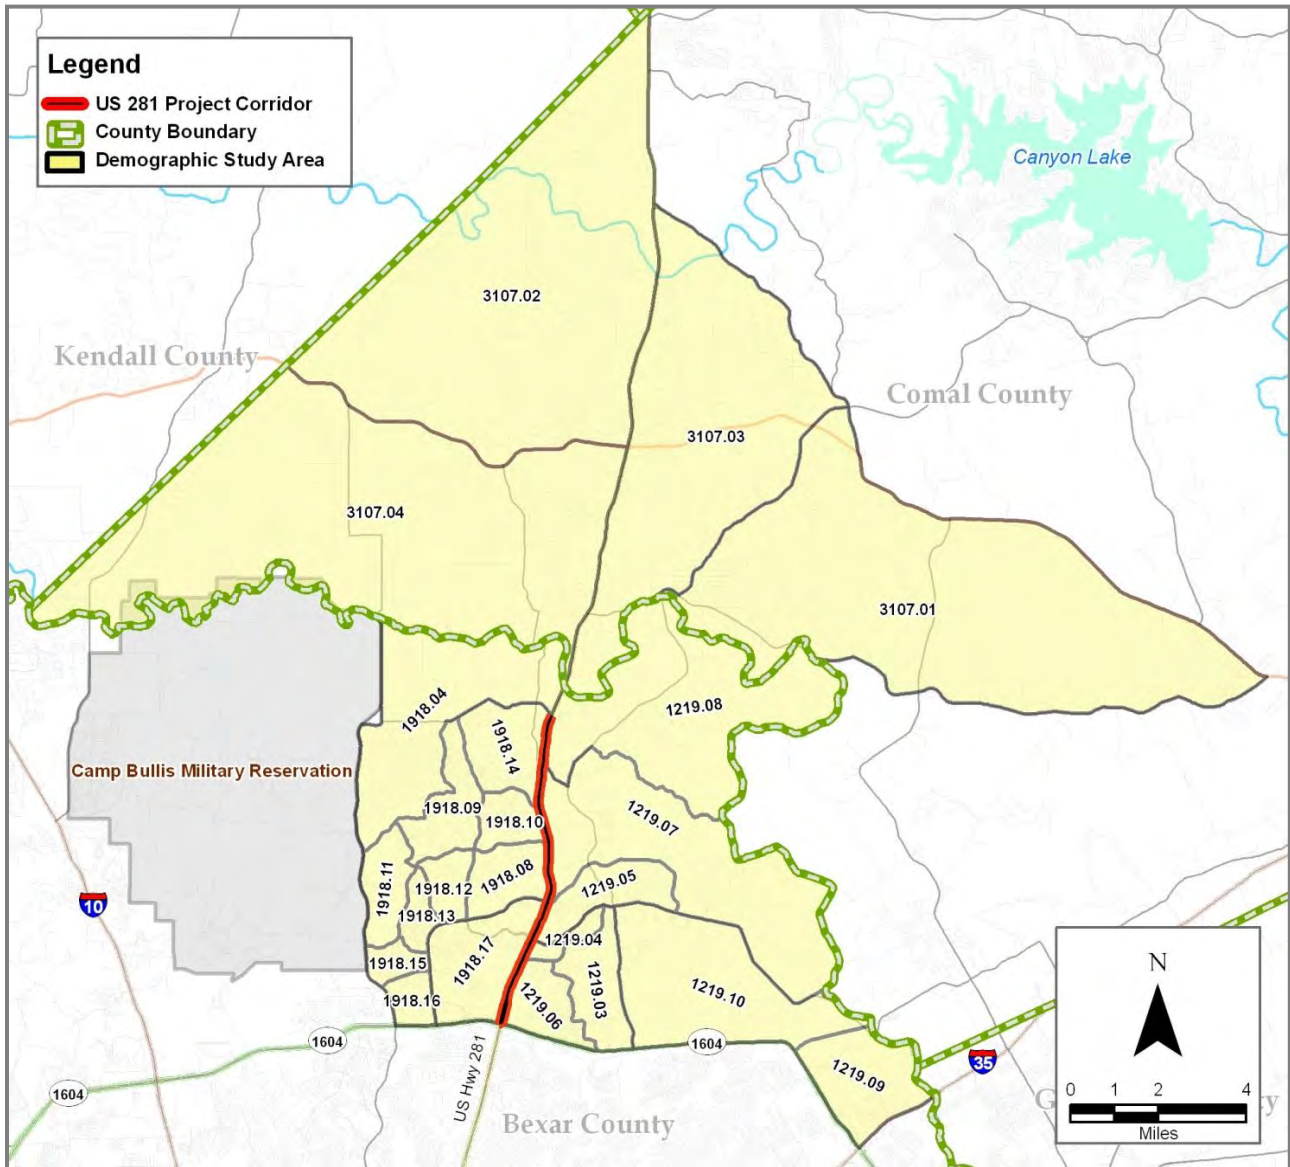

Chapter 3 – Affected Environment and Environmental Consequences

Historical Growth

Chapter 1 – Need for and Purpose of the Proposed Action, and Chapter 3 – Affected Environment and Environmental Consequences use a Demographic Study Area to describe the historical growth that has occurred along the US 281 project corridor. 1980, 1990, 2000, and 2010 Census and the 2006-2010 American Community Survey data was sourced to describe the historical growth in the Demographic Study Area. **Figure G-4** highlights the census tracts in the Demographic Study Area.

11 * Note: 1980 census geography is not an exact match with 1990, 2000, or 2010 geography. While the area represented in 1980 counts are a bit larger, these
 12 statistics are intended only to show a growth pattern in general and have not been used for analysis purposes in this Draft EIS.

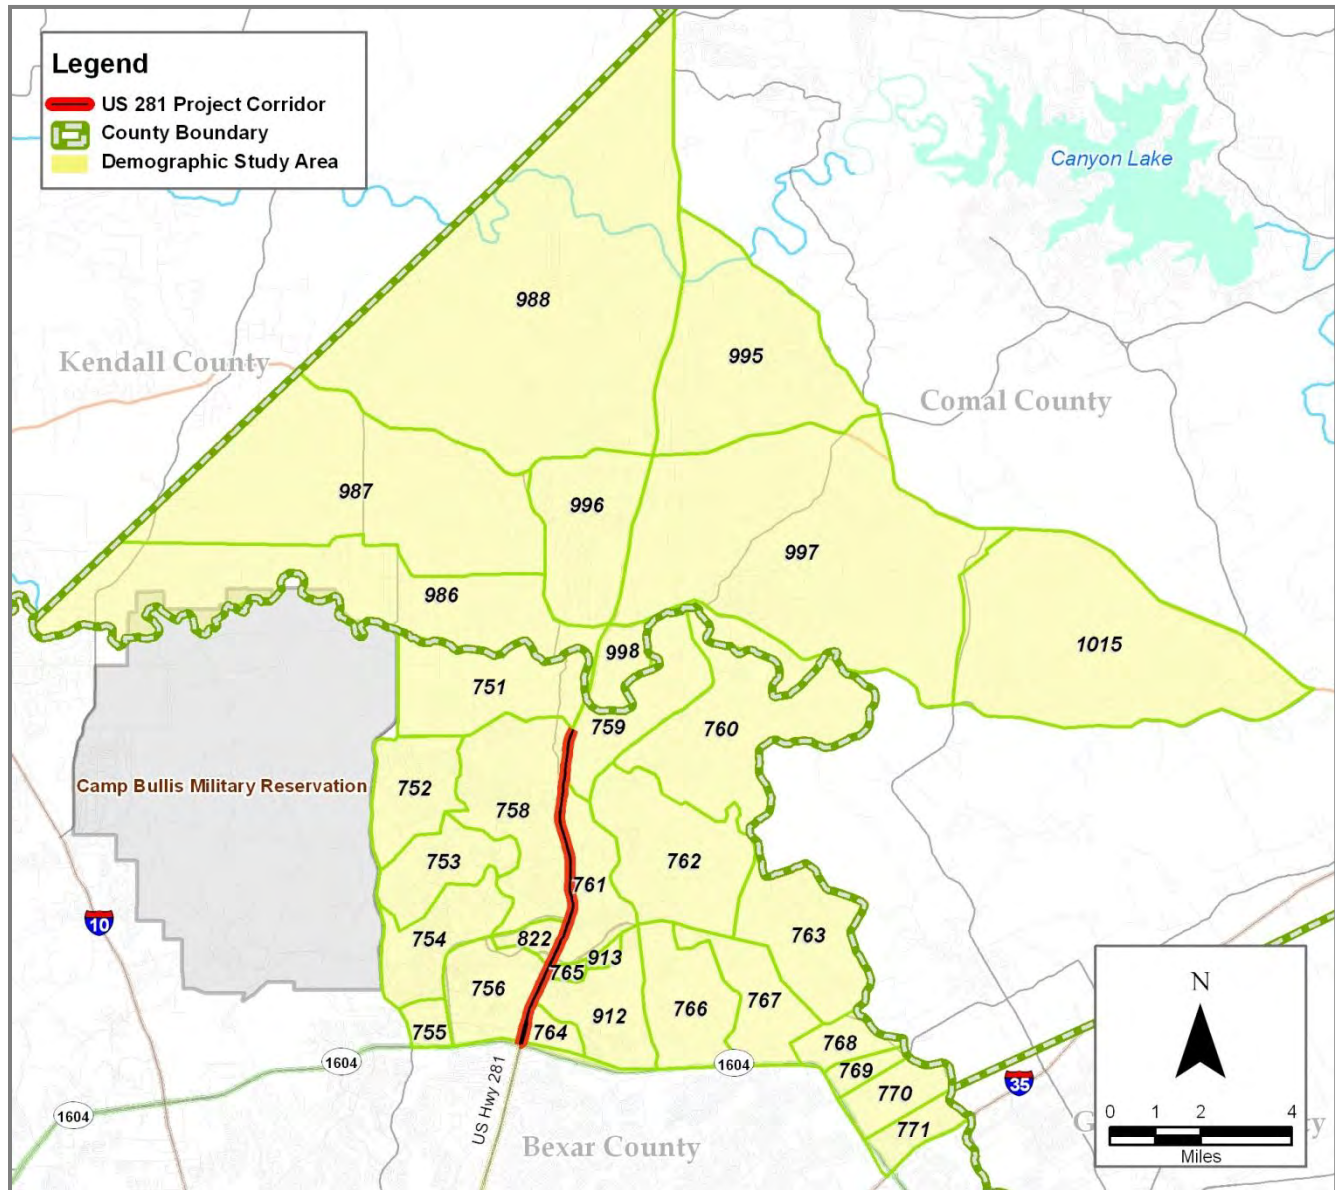

13

Forecasted Growth

Chapter 1 – Need and Purpose of the Proposed Action, and Chapter 3 – Affected Environment and Environmental Consequences use the Demographic Study Area to analyze the forecasted growth along the US 281 Project Corridor. To help ensure consistency with local and regional plans and policies, the demographic projections developed by the SA-BC MPO for *Mobility 2035* were used. The SA-BC MPO forecasts population and employment growth using geography called TAZs. 2005 was used as the base year and the data was sourced from the Census Bureau 2005 estimates. Forecasts were produced for 2008, 2015, 2025, and 2035. **Figure G-5** highlights the TAZs in the Demographic Study Area.

Socioeconomics

As part of **Chapter 3 – Affected Environment and Environmental Consequences**, socioeconomic characteristics are discussed which includes analysis of Environmental Justice (EJ), Limited English Proficiency (LEP) and other socioeconomic characteristics. Data from the 2010 Census, ACS 2006 to 2010 5-year survey, and the BLS were used to analyze the socioeconomic characteristics along the US 281 Project Corridor for this Draft EIS.

2010 Census data include: block level data for total population, race and ethnicity.

ACS 2006 to 2010 5-year survey data include: block group level data for household income, poverty, tract level data for ability to speak English, linguistically-isolated households and household occupancy, and county level data for employment and commute characteristics,

BLS was for year-to-year employment/unemployment statistics at the county and Metropolitan Statistical Area (MSA) level.

The socioeconomic characteristics in this Draft EIS are generally analyzed within the Demographic Study Area (with the exception of BLS Employment statistics, which are analyzed at the county level). As mentioned above, a redistricting effort took place between the 2000 and 2010 Census. **Table G-10** is a conversion chart between the 2010 and 2000 geographies at the census tract level within the Demographic Study Area.

Environmental Justice (EJ) Populations

For the analysis of EJ two study areas were developed, the Study Area for Race and Ethnicity and the Study Area for Income and Poverty. These two study areas are distinct because the most detailed information on these topics are available in different geographies and are sourced from different Census Bureau products. The Study Area for Race and Ethnicity includes all Census Blocks located within or immediately adjacent to the rights-of-way (ROWs) of the Proposed Build Alternatives and the Study Area for Income and Poverty includes all Census Block Groups located within or immediately adjacent to the ROWs of the Proposed Building Alternatives. For this study, immediately adjacent means all geographies that intersect a 500-foot buffer around the centerline of the existing US 281 roadway. The study areas represent the area where direct effect would potentially be experienced as a result of the proposed US 281 project. **Figure G-6a through G-6c and Figure G-7.**

**1 Minority Populations**

2 A minority is defined as a person who is the following race or ethnicity:

- 3 • Black (having origins from any of the black racial group of Africa)
- 4 • Asian-American (having origins from of the original peoples of the Far East, Southeast Asia, the Indian
- 5 Subcontinent, of the Pacific Islands)
- 6 • American Indian and Alaska Native (having origins from any of the original people of North America
- 7 and who maintains cultural identification through tribal affiliation or community recognition)
- 8 • Hispanic or Latino (of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish
- 9 culture or origin, regardless of race).

10 Several blocks in the Study Area for Race and Ethnicity contain a population of zero. **Table G-11** provides data for all blocks
11 that contain a population. The following blocks have reported zero population in the 2010 Census.

- 12
- 13 • Block 2001, Block Group 2, Census Tract 1219.05, Bexar County, Texas
- 14 • Block 1006, Block Group 1, Census Tract 1211.18, Bexar County, Texas

Low Income Populations

Low income is defined in US DOT Order 5610.2(a) as a person whose median household income is at or below the U.S. Department of Health and Human Services (USDHHS) poverty guidelines. The USDHHS poverty guidelines are categorized by the number of persons living in a household. The average household size in Bexar County was 2.75 people and in Comal County was 2.6 people in 2010 (U.S. Census Bureau 2010). The 2012 USDHHS poverty guideline for a 2-person household is \$15,130 and for a 3-person household is \$19,090 (USDHHS 2012). This value was adjusted to 2010 dollars using the Consumer Price Index to ensure an equal comparison with Census data, which are reported in 2010 dollars. For the EJ analysis, low-income is considered as a median household income equal to or less than \$18,136.

Persons with Limited English Proficiency (LEP)

2010 Census geography was used for the analysis of LEP in the Demographic Study Area. LEP is defined as having “limited ability to read, write, speak, or understand English” (67 Federal Register (FR) 41459). For the purposes of this study LEP is defined in two ways:

- those that speak a language other than English and speak English “less than very well”
- linguistically-isolated households which refer to those households where all members, 14 years of age and older have at least some difficulty with English

Demographic Analysis for Indirect Effects

Chapter 4 – Indirect Effects analyzes demographic trends and forecasts at a larger scale known as the Area of Influence (AOI). The AOI represents the geographic area where probable encroachment-alterations and induced land development effects of the US 281 Corridor Project are likely to occur and includes portions of Bexar, Blanco, Comal and Kendall counties. The US Census was used to analyze historical population growth trends and TSDC and ESRI data were used to analyze the forecasted growth around and within the AOI. A map of the AOI is shown in **Figure G-8**.

Figure G-8: Area of Influence for Indirect Impacts Analysis

Demographic Analysis for Cumulative Effects

Chapter 5 – Cumulative Effects analyzes demographic trends and forecasts within a study area referred to as the Socioeconomic and Community Resource Study Area (RSA) (**Section 5.3.2 Socioeconomic and Community Resources**). This RSA represents the geographic area that could be affected by reasonably foreseeable future development. Population, minority, and age statistics from the 2010 Census and income from the 2006-2010 American Community Survey were used in **Chapter 5** and were analyzed at the Census Tract level. A map of the Socioeconomic and Community RSA and the corresponding 2010 Census Tracts is shown in **Figure G-9**. **Table G-23** provides population and minority population from the 2010 Census, **Table G-24** provides median household income data from the 2006-2010 American Community Survey and **Table G-25** analyzes the age group distribution within the RSA from the 2010 Census.
